Bulletin

Flashing and Weepholes Required on All Residential Brickwork

The 1995 CABO 1 and 2 Family Dwelling Code and the 1994 Edition of the Standard Building Code* call for flashing and weepholes in masonry veneer.

The diagram below indicates location where through-wall flashing and weepholes are required. Construction details are on the other side of this bulletin.

Note: Although brick veneer, wood frame construction has proven to be the most durable form of protecting a house from weather, wind-driven rain can penetrate the best brickwork. Southern Brick Institute strongly recommends compliance with the flashing and weephole requirements of the Cabo and Standard Building Codes.

*CABO 703.7; Standard Building Code 1403.1
